

Evergreen Turf specializes in producing only the finest hybrid bermudagrass sod. All of our varieties are non-allergenic, durable and attractive. Our sod varieties are all grown right here in Arizona and have been proven superior for our extreme weather conditions. Evergreen Turf varieties can also be overseeded for a truly evergreen look.

**Midiron** – There is a good reason why Midiron is the most popular variety of grass in Arizona. It is beautiful and easy to take care of. Midiron has a beautiful blue-green color and a medium textured leaf. In high-traffic areas Midiron will repair itself more quickly than any other variety. If your lawn is meant to be used as well as look attractive, Midiron is the grass for you. Because Midiron produces a very high quality lawn with a rotary mower, it requires the least amount of work on your part.

**Tifway 419** – Tifway is the most durable of the hybrid bermudas. This is why Tifway is used on more professional sports fields than any other bermudagrass variety. Tifway has a beautiful dark green color and a finer texture than Midiron. Tifway is also great in home lawns. Tifway can be mowed with a sharp rotary mower, or a reel mower can be used for a more manicured look.

**Tifgreen 328** – Tifgreen has a very fine texture and a bright green color. This variety was originally developed for use on golf greens and it is your best choice if you prefer a highly manicured appearance. Tifgreen can be mowed with a sharp rotary mower, however we recommend a reel mower for best results.

**Palmetto St. Augustine** – Palmetto St. Augustine is a semi-dwarf St. Augustine grass and is our best performer in shady conditions. Palmetto also thrives in full sun and is the most heat-tolerant St. Augustine. Palmetto has a coarse texture with a soft leaf. It has a very dark green color which makes a stunning lawn Palmetto should not be overseeded and should be mowed with a sharp rotary mower.

**TifSport** – TifSport is the new standard in turfgrass excellence. TifSport has superior turf density, an impressive root system, and good lateral growth, which give it a remarkable ability to recover from damage. Its upright leaf blade orientation and fine leaf texture help promote good footing on athletic fields. TifSport is different from other commercially available bermudagrasses in that it is regulated to insure purity. TifSport is required to be completely free from contamination and off-type grasses.

**Sealsle 1 Paspalum** – Sealsle 1 is a new salt-tolerant and drought resistant warm-season turfgrass. Not only does Sealsle 1 have the highest salt-tolerance of the warm-season turfgrasses, it is very cold hardy (growth @ 40 to 50°F), and it is the last of the warm-season grasses to go off color in the fall. It thrives in difficult conditions such as low light, high alkaline soils, and low oxygen associated with wet or boggy environments. It has a low fertility requirement. Sealsle 1 has a very attractive, rich dark green color and definitely deserves a closer look.
